

Product Developed

We have developed a Domestic Solid Waste Composter on the principle of Aerobic composting of tumbler type composting unit. A compost tumbler is a fully sealed container that can be rotated to mix the composting materials. The sealed container also helps contain the heat generated by the composting process, thereby speeding the process of converting kitchen and yard waste into compost. Compost tumblers are invented to make composting simpler and faster. Along with this product, we are also supplying the accelerator agent so as to speed up the process.

Tumbling composters are not the same as compost bins. Compost bins are designed to be set on the ground, and most compost bins have an open top and tumbler drum, it includes a feature that will 'flip' the composting materials as the drum turns.

Advantages of our product

- Speeds Up the Composting Process
- Keeps Rodents, Raccoons, and Pets Out of Compost
- Eliminates Composting Odors
- Tidy and Attractive

How to use

1. Fill the waste into drum every day.(dry leaves 50% +green leaves 50%)
2. Use one handed compost booster provided with unit for every loading.
3. After filling the waste give five to seven rotation to drum.
4. Once first drum is completely fills, leave it for 60 days and use the second drum.
5. Once in a week take out the compost tea through tap and use as liquid compost by adding 10 times water in it.
